# Week 1 笔记

## by 骆剑 2017/5/21

#### Introduction

Supervise Learning 监督学习

数据有标签,模型用来预测输入对应的输出

Regression 回归:预测连续的输出值

Classification 分类: 预测离散的输出值

UnSupervise Learning 非监督学习 数据没有标签,模型用来学习数据之间的关系

# Linear Regression with one variable

(单变量线性回归)

# Basic Concept (基本概念):

1. Hypothesis: 
$$h_{\theta}(x) = \theta_0 + \theta_1 x$$

(假设函数)

2. Parameters: 
$$\theta_0$$
;  $\theta_1$ 

3.Cost Function: 
$$J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - \frac{1}{2m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}))$$

 $y^{(i)}\big)^2$ 

(损失函数)

4.Goal: minimize 
$$J(\theta_0, \theta_1)$$

 $\theta_0, \theta_1$ 

【注】: 式 3 中的  $x^{(i)}$   $y^{(i)}$  表示第 i 个 example 样本的 x 和 y

样本总数为 m

### Gradient descent algorithm (梯度下降算法)

Repeat until convergence (循环直至收敛)

{//同步更新, 赋值(3)(4)必须在计算(1)(2)之后, 设 tmp

$$tmp0 := \theta_0 - \alpha \cdot \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$$
 (1)

$$tmp1 := \theta_1 - \alpha \cdot \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$$
 (2)

$$\theta_0 := \text{tmp0} \tag{3}$$

$$\theta_1 := tmp1 \tag{4}$$

}

推导(一)

$$tmp0 := \theta_0 - \alpha \cdot \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$$
$$:= \theta_0 - \alpha \cdot \frac{1}{m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})$$

推导(二)

$$tmp1 := \theta_1 - \alpha \cdot \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$$

$$:= \theta_1 - \alpha \cdot \frac{1}{m} \sum_{i=1}^{m} [ (h_{\theta}(x^{(i)}) - y^{(i)}) \cdot x^{(i)} ]$$

#### 偏导推导过程(一)

$$\begin{split} \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1) &= \frac{\partial}{\partial \theta_0} \{ \frac{1}{2m} \sum\nolimits_{i=1}^m \left( h_\theta \big( x^{(i)} \big) - y^{(i)} \big)^2 \} \\ &= \frac{\partial}{\partial \theta_0} \{ \frac{1}{2m} \sum\nolimits_{i=1}^m \left( \theta_0 + \theta_1 x^{(i)} - y^{(i)} \right)^2 \} \\ &= \frac{1}{m} \sum\nolimits_{i=1}^m \left( \theta_0 + \theta_1 x^{(i)} - y^{(i)} \right) \\ &= \frac{1}{m} \sum\nolimits_{i=1}^m \left( h_\theta \big( x^{(i)} \big) - y^{(i)} \right) \end{split}$$

#### 偏导推导过程(二)

$$\begin{split} \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1) &= \frac{\partial}{\partial \theta_1} \{ \frac{1}{2m} \sum\nolimits_{i=1}^m \left( h_\theta \big( x^{(i)} \big) - y^{(i)} \big)^2 \} \\ &= \frac{\partial}{\partial \theta_1} \{ \frac{1}{2m} \sum\nolimits_{i=1}^m \left( \theta_0 + \theta_1 x^{(i)} - y^{(i)} \right)^2 \} \\ &= \frac{1}{m} \sum\nolimits_{i=1}^m \left( \theta_0 + \theta_1 x^{(i)} - y^{(i)} \right) \\ &= \frac{1}{m} \sum\nolimits_{i=1}^m \left[ \ \left( h_\theta \big( x^{(i)} \big) - y^{(i)} \right) \cdot x^{(i)} \ \right] \end{split}$$
